Invoice with Calculation

Purpose:

- To create a web-based invoice system where users can enter product/service details and automatically calculate totals, taxes, and discounts.
- Helps students learn form handling, dynamic calculations, DOM manipulation, and front-end UI design.
- Useful for understanding basic billing systems, financial calculations, and invoice generation logic.

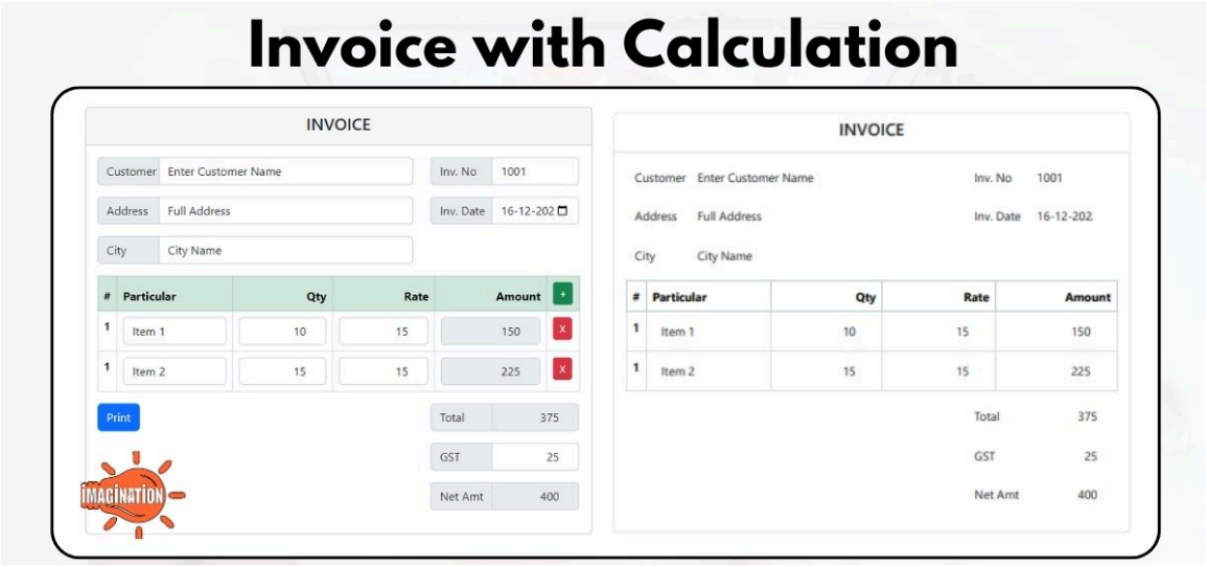
Core Features:

1. **Input Form**
    - Add multiple items with fields: Item Name, Quantity, Price per Unit.
    - Optionally add a discount percentage per item.
2. **Calculation Logic**
    - Calculate total for each item (Quantity × Price).
    - Sum up all item totals for **subtotal**.
    - Apply discounts if provided.
    - Apply taxes (e.g., VAT, GST) if applicable.
    - Calculate **grand total** dynamically.
3. **Invoice Display**
    - Show all items in a table format with calculated totals.
    - Display subtotal, total discounts, taxes, and final total.
4. **Reset / Clear Functionality**
    - Allow clearing all inputs to create a new invoice.
5. **Optional Features**
    - Save invoice data using **localStorage.**
    - Export invoice as PDF or print invoice.
    - Responsive design for mobile or tablet screens.
    - Validate inputs (no negative numbers, required fields).

UI Design

Screens / Sections:

1. **Input Section**
    - Fields for item details: Name, Quantity, Price, Discount.
    - “Add Item” button to include more items.
2. **Invoice / Output Section**
    - Table listing items and their totals.
    - Display subtotal, discounts, taxes, and grand total.
    - “Reset” button to clear the form.

Validation


- Negative or zero values for quantity or price should be blocked.
- Empty fields must be validated.
- Discounts cannot exceed item total.
- Very large numbers handled gracefully.
- Reset should clear all calculated totals and input fields.
